Reg No. 192373044

1. selecting an appropriate object oriented methodology Scenario given.

Comparison for two methods

Feature	Booch Method	UML-based development
Focus	object design and implementation	complete system modelling and design
Diagrams	class, object, interaction diagrams	use case, class diagram, Sequence, Activity
Requirement	Moderate support	Excellent support
Ease of understanding	Moderate	Easy and widely used

2. Recommended methodology - UML based development

Justification

- Handles changing requirements easily
- Provides clear visual diagrams
- Improves communication between developer and client

- support analysis, design, coding and maintenance
- It helps in identifying error and design issues early
- By reducing the time and cost

3. Object modelling during system analysis

- Identifies real-world object in the system
- Defines attributes and methods of each object
- shows the relationships between object.
- Makes the system easier to understand develop
- Represent the system visually using UML class diagram.
- Helps in detecting missing requirements and design error at an early stage

4. To identify possible classes and relationships

Classes	Relation ships
• User • vehicle • Parking slot • Booking • Payment • Admin	• user books → booking • Booking uses → parking slot • user owns → vehicle • Booking generates → payment • Admin manages → parking slot

5. UML based development supports requirement changes by

- updating diagram whenever requirement change
- Marking modifications easy without affecting the entire system.
- Improving communication between clients and developers.
- supporting iterative development and maintenance
